For Immediate Release

Trident Systems LLC announced today that the Automated Documentation System, designed to produce automated as-configured documentation for HP Integrity servers running HP-UX, will be expanded to include HP's Virtual Server Environment. The Automated Documentation System provides system administrators with the ability to maintain accurate and complete system documentation.

The expanded release of the Automated Documentation System will be available for customer use in the 3d quarter, 2007.

Ralph Burnette, a UNIX system administrator and consultant for over 18 years, states, "The new Automated Documentation System will provide system administrators with in-depth, as-built system configuration details to assist in maintaining and rebuilding servers when other methods fail."

The Automated Documentation System is designed to document servers and maintain the documentation in a centralized, web-based repository. The system is designed to run automatically at the end of each business day to ensure that the latest server configuration changes are captured and maintained for reference with a set of history files in both a web-based and text format. The Automated Documentation System relieves the necessity of manual record-keeping in spreadsheets, etc. that is rarely kept up to date.

Trident Systems, LLC has been provided UNIX consulting services since 1987 and specializes in HPUX for both the PARISC and Integrity servers running. Ralph Burnette of Trident Systems, LLC is a Certified HP-UX System Administrator and holds masters degrees in computer science and business administration.
